		Total	22

Central University of Kashmir				
Course Title	Mathematics II	Course Code	BT 201	
Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Theory	Department	Information Technology	
Credits	4	L	T	P
Semester	2 nd	4	0	0
Course Objectives				
- To recall and remember basics of matrices, complex numbers, and differential calculus. - To understand the concepts of basic mathematical methods for matrices, complex numbers and differential calculus. - To apply Mathematical approach to solve engineering problems.				
Learning Outcomes				
- Students will be able to compare and analyze the methods in matrices, complex numbers, and differential calculus. - Students will be able to predict and evaluate the problems in matrices, complex numbers, and differential calculus.				
Course Synopsis				
There are four main sections: Differential Equations(first-order DEs, second-order linear ODEs, higher order DEs, series solution of DEs); Linear Algebra (vectors, matrices) and Vector Calculus (differentiation and integration of vectors).				
Course Outline / Content				
Unit	Topics			Week
1.	Differential Equations – Differential equations of higher order, existence and uniqueness of solutions, general linear differential equation of order n, linear operators, fundamental theorem on linear differential equations, General solutions with constant coefficients (Distinct real roots and repeated real roots) and Initial Value Problem.			4
2.	Integral Calculus - Differentiation under the sign of integration. Double and triple integrals, change of order of integration, change of variables.			4
3.	Matrices - Introduction, Orthogonal and unitary matrices. Triangular matrices, symmetric and skew-symmetric matrices, singular matrices, rank of a matrix (normal form and triangular form), equivalent matrices, elementary transformations, Partitioning of Matrices.			4
4.	Inverse of a matrix, solution of simultaneous equations by elementary operations, Cramer’s rule, normal form, Caley-Hamilton Theorem, Secular Equation, Eigen values and Eigen vectors of a matrix.			4
References				
1.	Advanced Engineering Mathematics by E.Kreyzig.			
2.	Advanced Engineering Mathematics by H.K. Dass.			
3.	Ordinary and partial Differential equation, M.D.Raisingania, S.Chand.			
4.	Linear Algebra,Hoffmann&Kunze, Prentice-Hall.			
5.	Integral Calculus by Shanty Narayan.			

Central University of Kashmir				
Course Title	Basic Electrical Engineering	Course Code	BT 204	
Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Theory	Department	Information Technology	
Credits	04	L	T	P
Semester	2nd Semester	4	0	0
Course Objectives				
- To impart a basic knowledge of electrical quantities such as current, voltage, power, energy and frequency. - To provide working knowledge for the analysis of basic DC and AC circuits used in electrical and electronic devices. - To describe fundamental theorems of electrostatics, electromagnetic and electrical circuit. - To impart the knowledge of various configurations, characteristics and applications of various electrical devices.				
Learning Outcomes				
By the end of the course the students should be able to: - Apply the learned concepts to predict the behaviour of any electrical and magnetic circuit. - Apply the learned concepts to formulate complex AC, DC circuits. - Apply the concepts to analyse and solve electrical circuits using network laws and theorems. - Apply the concept of power, power factor and its improvement.				
Course Synopsis				
The course has been divided into four Units, Unit I gives the idea of the basics of the electrical circuits and some basic theorems. Unit II gives the idea of the sources used in electrical circuits and also basic analysis of D.C circuits. Other theorems related to D.C circuits have been discussed in Unit III along with the introduction of A.C circuitry. Unit IV discusses A.C in greater detail along with some basic concepts of electromagnetism.				
Course Outline / Content				
Unit	Topics		Week	
1.	Electric Circuit Laws: Basic electric circuit terminology, Ohm's law, Kirchhoff's current law. (KCL) and Kirchhoff's voltage law (KVL) circuit parameters (Resistance, Inductance and capacitance). Series and Parallel combinations of resistance, Inductance and capacitance, Meshloop Analysis, Nodal analysis.		03	
2.	Energy Source: Ideal and practical voltage and current sources and their transformation. Dependent Sources: Dependent voltage sources and dependent current sources. D.C. Circuit Analysis: Power and energy relations, Analysis of series parallel d.c. circuits, Delta star (Y) Transformation, Loop and Nodal methods		04	
3.	Thevenin's, Norton's theorem, Maximum Power transfer theorem, Superposition theorem. A.C. Circuit Analysis: Basic terminology		05	

	and definitions, Phasor and complex number representations, solutions of sinusoidal excited	
4.	RC circuits, power and energy relations in a c circuits, Applications of network theorems to A.C. circuits, Resonance in series and parallel circuits. Magnetically Coupled Circuits: Mutual inductance, Theory of magnetic circuits and electromagnetism. Transformers.	04
Text Books		
1.	Electrical Technology by B.L Theraja, S.Chand group	
2.	Nagrath I.J., Basic Electrical Engineering, Tata cGraw Hill.

1.	Toro V. Del, Principles of Electrical Engineering, Prentice- Hall International.	
2.	Hayt W.H. & J.E. Kemmerly, Engineering Circuit Analysis, McGraw Hill.	
3.	Basic Electrical Engineering by V.K Mehta, Rohit Mehta, S.Chand group	
4.	Fitzgerald A.E., D.E., Higginbotham &AGrabel, Basic Electrical Engineering, McGraw Hill.	
5.	Cotton H., Advanced Electrical Technology, Wheeler Publishing.	

Central University of Kashmir				
Course Title	Engineering Mechanics	Course Code	BT 205	
Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Theory	Department	Information Technology	
Credits	03	L	T	P
Semester	2 nd	03	0	0
Course Objectives				
- To provide an introductory treatment of engineering Mechanics to the students of engineering. - To introduce students to the analysis of dynamic and static systems encountered in engineering design practice. - To identify appropriate structural system for studying a given problem and isolate it from its environment.				
Learning Outcomes				
Upon successful completion of the course, student should be able to: - Apply and demonstrate the concepts of mechanics to practical engineering problems. - Apply scalar and vector analytical techniques for analyzing forces in statically determinate structures. - Apply fundamental concepts of trusses to practical problems.				
Course Synopsis				
Course has been divided into four units, Unit-I introduce the concept of elastic behavior, stress-strain relationship, concept of strain energy that forms basis of analysis in many cases. Unit-II explains the concept of trusses and numerical truss analysis. Unit-III discusses the centroid of different bodies and moment of inertia after that Unit-IV is related to beams which may be simply supported, fixed at one or both ends. The analysis includes the computations of bending moment, shear force and shear stress.				
Course Outline / Content				
Unit	Topics	Week		
1.	Introduction to Engineering Mechanics: Applications, Definition, Stress, Strain, Tensile and Compressive Stress, Shear Stress, Elastic Limit, Hook's Law, Poisson's Ratio, Modulus of Elasticity, Modulus of rigidity, Strain Energy, Stress due to different types of axial loading, Gradually applied Loads, Suddenly applied loads, Impact load. Bulk Modulus, Bar of uniform Strength, Temperature Stress, volumetric Strain.	04		
2.	Members forces in trusses: Planer truss structure, trust joint identification, strategy for planer truss analysis. Statical determinacy and Stability Of Planer Trusses. Analysis of Framed Structure, perfect Frame, Deficient Frame. Numerical truss analysis (Method of joints and method of selection)	04		
3.	Introduction to centroid and center of gravity: Properties of planes and solids- Centroid and moment of inertia; centroid of plane area and solid bodies. Moment of a force about a point, Moment of inertia of plane area. Theorem of parallel axis, Theorem of perpendicular axis, radius of gyration, composite ideas.	04		

4.	Bending Stress in Beams: Types of supports, Simply Supported Beam, Fixed Beam, Continuous Beam, Theory of Simple Bending, Beams with Uniform Bending, unsymmetrical bending, Combined Direct and Bending Stress, Shear Stress in Beams.	03
Text Books		
1.	S. Ramamrutham, Strength of Materials, Dhanpal Rai & Co., ko	
2.	Timoshenko, S. & Young D. H., Engineering Mechanics, McGraw Hill	
References		
1.	Tayal, A. K., Engineering Mechanics- Statics and Dynamics, Umesh Publications	
2.	Khurmi RS(2015), Engineering Mechanics, S. Chand & Co	
3.	Merriam J. L. and Kraige L. G., Engineering Mechanics – Vol. I and II, John Wiley	
4.	R. K. Bansal, Engineering Mechanics and Strength of Materials, Laxmi Publication.	

Central University of Kashmir				
Course Title	Basic Electrical Engineering Lab	Course Code	BT 208 L	
Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Laboratory	Department	Information Technology	
Credits	02	L	T	P
Semester	2 nd semester	0	0	2
Course Objectives				
- To understand the basic electrical laws like KCL, KVL, Ohms law - To demonstrate the use of various electrical circuit solving theorems including Thevenin's theorem, Norton's theorem, maximum power transfer theorem, Reciprocity theorem. - To study resonance of RLC circuit in series and Parallel Combinations. - To provide practical knowledge on various electrical circuits including series-parallel combinations with R, L and C. - To demonstrate measurement of current, voltage and power in electrical circuit.				
Learning Outcomes				
By the end of this course, the student should be able to: - Apply the different circuit laws in practical circuits. - Apply various network theorems to solve circuit parameters. - Apply the common measurement methods used for calculating current, voltage and power in circuits. - Apply various methods calibration of measuring meters.				
Course Synopsis				
This lab course includes the experiments related to both A.C and D.C circuits. It builds the understanding of the student to be able to create complex circuits. The basic parameters used in electrical sciences are studied in greater detail and all the approaches used to solve circuits are verified practically in this lab course.				
Course Outline / Content				
S.No	Labs			
1.	To study the color coding of resistors.			
2.	Connection of Ammeters, Voltmeters and multi-meters in DC and AC circuits and selection of their ranges.			
3.	Verification of Ohms Law.			
4.	To verify the KVL and KCL in DC circuits.			
5.	Verification of Superposition theorem			
6.	Verification of Thevenin's theorem.			
7.	Verification of Norton's theorem.			
8.	Verification of Maximum power transfer theorem.			
9.	To verify the star delta transformation of networks.			
10.	Basic R, L, C circuits excited from A.C			
11.	To measure the power and power factor in three phase AC circuits.			
12.	To study the handling of CRO and use it for the study of different voltage waveforms			

Text Books

2.	B.L Thereja and A.K. Thereja , "A Textbook Of Electrical Technology".
Simulation Tools	
1.	Pspice
2.	NGSpice

Central University of Kashmir				
Course Title	Business Communication & Presentation Skills	Course Code	BT 209	
Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Theory	Department	Information Technology	
Credits	2	L	T	P
Semester	2 nd	2	0	0
Course Objectives				
The course aims to help the students: • To improve reading comprehension skills through intensive and extensive reading. • To summarize and paraphrase information in a text. • To identify author's purpose and tone. • To recognize and rectify common errors in grammar. • To use punctuation to the best purpose. • To make use of modals and active and passive voice appropriately. • To learn the norms of academic and research writing. • To learn the steps in report writing, along with the types and outline of reports. • To get acquainted with the APA and MLA referencing styles.				
Learning Outcomes				
At the end of the course student will be: • Able to distinguish main idea(s) from supporting details and distinguish fact from opinion. • Able to identify author's purpose and tone. • Able to summarize and paraphrase information in a text. • Able to write a professional email. • Able to write a job cover letter. • Able to write a résumé with its essential elements. • Able to write a project proposal with its essential elements. • Able to greet others, introduction of one's own self and initiate small talks fluently and confidently. • Able to express opinions and effectively show agreement and disagreement with the opinions of others. • Able to participate and be sufficiently understood in group discussions. • Able to prepare for interviews by demonstrating learning and verbal and non-verbal communication skills during mock interview.				
Course Synopsis				

This Course is divided into three Units. First Unit enlists the role of communication in the present time, definition of communication and skills required for technical communication. It also tells about various forms of technical writing methods. Unit II is about oral presentation and Speaking Skills, it explains different pursuits of presenting a topic to the audience. Unit III is about Career Oriental Communication, it enlists various methods to make resumes and prepare for job interviews.

Course Outline / Content		
Unit	Topics	Week
1.	Role Of Communication Information Age; Concept And Meaning of Communication; Skills Necessary For Technical Communication; Communications in a Technical Organization; Listening, Speaking, Reading and Writing as Skills. Objectivity, Clarity, Precision as Defining Features of Technical Communication; Various Types of Business Writing: Letters, Reports, Notes, Memos; Language And Format of Various Types of Business Letters.	4
2.	Oral Presentation and Professional Speaking: Basics of English Pronunciation; Elements of Effective Presentation; Body Language and Use of Voice During Presentation; Connecting with the Audience During Presentation; Projecting a Positive Image While Speaking; Planning and Preparing a Model Presentation; Organizing the Presentation to Suit the Audience and Context; Basics of Public Speaking; Preparing for a Speech.	4
3.	Career Oriental Communication: Resume and Biodata: Design & Style, Applying for a Job: Language and Format of Job Application. Job Interviews: Purpose and Process; How to Prepare for Interviews; Language and Style to be Used in Interview; Types of Interview Questions and How to Answer Them.	4

Central University of Kashmir				
Course Title	Biology	Course Code	BT 210	
Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Theory	Department	Information Technology	
Credits	03	L	T	P
Semester	2 nd	03	0	0
Course Objectives				
• Introduction to Basics of Biology which includes cell, the unit of life, Different types of cells and classification of living organisms. • Understanding what are biomolecules present in a cell, their structure function and their role in a living organism. Application of certain bio molecules in Industry. • Brief introduction to human physiology, which is essential for bioengineering field				
Learning Outcomes				
At the end of the course student will be: •Able to understand the Biological classification of Several Kingdoms. •Able to understand the basic properties of several types of cells. •Able to understand the basic chemical composition of living farms. •Able to understand the basic concepts of Genetics.				
Course Synopsis				
The course is divided into four Units. Unit I will give the insights of biology, Classification of Kingdoms. Unit II describes the concept of Cell, its properties and types. Unit III enlists the details of Biochemistry and Chemical Composition of living forms, and different Qualitative tests. Unit IV is about Mendelian Law, inheritance and Genetic Disorders.				
Course Outline / Content				
Unit	Topics			Week
1.	Introduction Science and Engineering, Biology, Applications of Biology, Biological Classification, Kingdom Monera, Kingdom Protista, Kingdom Fungi, Kingdom Plantae, Kingdom Animalia , Viruses			4
2.	Cell: The Basic Unit of Life What is a Cell?, Basic Properties of Cells , An Overview of Cell , Prokaryotic Cells, Eukaryotic Cells , Cell Cycle and Cell Division, M Phase , Meiosis , Cell Differentiation			4
3.	Biochemistry and Molecular Analysis Chemical Composition of Living Forms, Analysis of Chemical Composition, Carbohydrates, Amino acids and Proteins , Nucleic Acids , Lipids , Nature of Bonding and Qualitative Tests			4
4.	Genetics Mendelian Law, Mendel’s Laws of Inheritance, Gene Interaction, Multiple Alleles, Chromosomal, Theory of Inheritance, Linkage, Recombination (Crossing Over), Chromosome Mapping, Genetic Disorders.			4

Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Theory / Laboratory	Department	Information Technology	
Credits	4	L	T	P
Semester	1 st	4	0	0
Course Objectives				
The Course Objectives of this Course are: • To understand the various steps in Program processing/execution. • To be able to develop programs for mathematical and scientific problems. • To be able to choose data types and structures to solve mathematical and scientific problems. • To be able to develop modular programs using control structures. • To be able to develop the programming skills in general that will create the backbone of programming concepts in future.				
Learning Outcomes				
By the end of this course the students should be able to: • Develop simple algorithms/programs and flow charts to solve a problem. • Develop problem solving skills coupled with top down design principles. • Develop efficient and well-structured computer algorithms/programs. • Develop the skills for formulating iterative solutions to a problem. • Develop array processing programs coupled with iterative methods. • Develop text and string processing efficient programs. • Apply recursive techniques in programming. • Apply searching techniques and use of pointers. • Apply user defined data types. • Apply the various operations on Files.				
Course Synopsis				
This Course is divided into Four Units. Unit I gives an introduction to C programming, the concept of Flowcharts and algorithms, the different types of Languages, the C program structure, various Data types and Expressions in C. Unit II is about types of Operation we can perform in C and various Control Structures. Unit III is about function, their use benefits of using a Function, Array and their types and operations on Arrays, Structures and Unions. Unit IV is about Pointers, their use, String Fundamentals and concept of Files and File Operations.				
Course Outline / Content				
Unit	Topics			Week
1.	Introduction to C Programming: Engineering problem solving methodology, Flowcharts, Tracing flow charts, Algorithms, Need for computer Languages, computer languages,			3

	High-level languages, History of C, A simple C Program. C Language preliminaries: Program structure, C character set, Identifiers and keywords, Data types(User Defined & Inbuilt), Declarations, Expressions, statements symbolic constants, Library functions, preprocessors, # include, #define Input-Output: getchar, putchar, scanf, printf, gets, puts and other related input output functions.	
2.	Operators and expressions: Operators in C, Arithmetic, Unary, Logical, Bit-wise, Assignment and Conditional Operators. Control statements: if else, switch, break, continue, and goto statements, while, do-while, for statements, Nested loops, Loops using goto. comma operators and Variants of above Control Structure.	3
3.	Functions: Defining and accessing Functions, Passing Arguments to a Function, Function prototypes, Recursion, Library functions, Static functions. Arrays: Defining and processing, Passing arrays to a function, Matrices as 2D arrays, Multi-dimensional arrays. Enumerated, Structure, and Union Types: The Type Definition (typedef), Enumerated types, Structures–Declaration, initialization, Accessing Structures, Operations on Structures, Complex structures, Structures and Functions, Passing Structures through Pointers, Self Referential Structures, Unions.	4
4.	Pointers: Declarations, Passing pointers to a function, Operations on pointers, Pointer Arithmetic, Pointers and arrays, Arrays of pointers and Function Pointers. Dynamic Memory Allocation of Arrays and Higher Dimensional Arrays using malloc() Function. Strings Fundamentals: of character and strings, String Handling Library Functions, Pointer to Strings, Dynamic Allocation for Strings. File Handling: Files, ASCII files , Binary Files, File operation such as Storing , Retrieving and Updating a file.	3
Text Books		
1.	Schaums outline of Theory and Problems of programming with C : Gottfried	
2.	Mastering C by Venugopal, Prasad – TMH	
3.	Programming in ANSI C, BalaguruSwamy	
4.	Let us C, YashavantKanetkar	
References		
1.	Complete reference with C Tata McGraw Hill	
2.	Engineering Problem Solving with ANSI C, Delores M. Etter, Prentice Hall	
3.	C Programming, Ivor Horton, Wrox Press Limited	

4.	The C programming language : Kerninghan and Ritchie

Central University of Kashmir				
Course Title	Computer Programming Lab	Course Code	BT 214	
Degree	Bachelor of Technology	Branch	Computer Science & Engg.	
Course Type	Theory / Laboratory	Department	Information Technology	
Credits	2	L	T	P
Semester	1 st	0	0	2
<i>Course Objectives</i>				
The Course Objectives of this Course are: - To combine the elements of the C language in developing structured programs. - To demonstrate the skills necessary to correctly compile, debug, and test programs in C.				
<i>Learning Outcomes</i>				
By the end of this Course the student should be: - Able to implement the algorithms and flowcharts in terms of programs for solving Mathematical and Engineering problems. - Able to learn elementary techniques involving arithmetic operators and mathematical expressions, appropriate use of selection (if, switch, conditional operators) and control structures. - Able to design and develop Computer programs, analyzes, and interprets the concept of pointers, declarations, initialization, operations on pointers and their usage. - Able to define data types and use them in simple data processing applications also he/she must be able to use the concept of array of structures. - Able to define union and enumeration user defined data types.				
<i>Course Synopsis</i>				
- Developing programs to implement Concepts of Basic data types, variables, input and output statements. - Developing programs to implement Concepts of Conditional and control structures. - Developing programs to implement Concepts of Arrays (one and two dimensional). - Developing programs to implement Concepts of Searching and Sorting. - Developing programs to implement Concepts of Functions and Recursion. - Developing programs to implement Concepts of Pointers. - Developing programs to implement Concepts of Structures, Unions and Enumeration. - Developing programs to implement Concepts of Dynamic memory allocation. - Developing programs to implement Concepts of Linked Structures. - Developing programs to deal with data in files.				
Course Outline / Content				
Programs to be implemented in Lab			Week	
1. Programs to understand how integers, characters, and strings are stored and represented in C. 2. Programs to understand the ASCII character encoding. 3. Programs to understand how to use different operators available in C. 4. Programs to understand differences between a logical and arithmetic operators. 5. Programs to understand differences between a logical and bitwise operators.			In accordance with the Theory course of BT106	

6. Programs to obtain a full understanding of signed, unsigned, long and short numbers in C. 7. Programs to understand exactly how numbers are represented in computers (octal, hexadecimal and binary numbers systems). 8. Programs to evaluate algebraic expressions in C. 9. Programs to understand printing of message on output screen. 10. Programs to understand printing of various data types using different output functions. 11. Programs to exercise all flags in printf() functions. 12. Programs to understand printing of display patterns of numbers and asterisks. 13. Programs to understand taking input from user using different input functions. 14. Programs to exercise all flags in scanf() functions. 15. Programs to understand how arrays work in C, how to use them, and how they are stored in memory. 16. Programs to understand searching in an array. 17. Programs to understand sorting techniques using arrays. 18. Programs to understand pointers in C. 19. Programs to understand the relationship between array indexing and pointer arithmetic. 20. Programs to understand dynamic memory allocation especially with respect to 1D and 2D arrays. 21. Programs to understand modularize of code using functions. 22. Programs to implement function with/without arguments and with/without return types. 23. Programs to understand direct and indirect recursions using functions. 24. Programs to use pointer to pass the address of data and arrays to functions. 25. Programs to understand static data types and static functions. 26. Programs to understand creating, accessing and using structures. 27. Programs to understand use of arrays of structures. 28. Programs to understand pointers to structures and pointers as structures members. 29. Programs to understand creating, reading, writing a file. 30. Programs to understand taking input through arguments to main() function
